# SHONNER PRESS

*PyTravCalc 3.1.0b*

**PyTravCalc** is a Windows program for calculating die rolls for Mongoose Traveller 2nd Edition. It's written in Python 3.9.4 and includes **PyDiceroll 3.2** for its die rolling. Source for **PyDiceroll 3.2** can be found at its [GitHub](#) repository.

**PyTravCalc** features minor logging and error tracking at this time.

This documentation explains how to install and use **PyTravCalc** for die roll calculations.

python v3.9.4

release v3.1.0b

The Traveller game in all forms is owned by Far Future Enterprises. Copyright 1977 - 2021 Far Future Enterprises. Traveller is a registered trademark of Far Future Enterprises.

## INTRODUCTION

### 1.1 Preface

I've written various die rolling programs for various computers over the decades. Every computer language had its own way of randomly generating numbers for dice results. These were pseudo random results, but still pseudo random enough to be useful for what I needed. I remember writing a Risk! game on the computer, and programming the die rolls needed for comparisons between players. That was back in 1989. I wish I still had listings from that program. And from others. That was back when computer programmers printed out their program listings and desk-checked them in 24-hour restaurants at 2am.

The reason I wrote a “calculator” for Mongoose Traveller 2nd Edition was because I had tried some from other programmers (most of them were web-based and for Classic Traveller, if I recall), but none of them did more than 2D rolls. I'm guessing by now they do, because more people are playing Mongoose Traveller 2nd Edition.

Anyway, at the time when I first made this program, I didn't know how to write programs that ran in the browser. So my other option was to write the program in Windows, and use whatever GUI for Python that looked best. At the time, it was [PyQt](#) that I liked. [wxPython](#) and [Tkinter](#) didn't have nearly the ease-of-use and production value that PyQt had.

Seven years ago, when I released very early versions that would eventually lead up to this program's design, I knew that very few people were still using computers. Most were using their phones to roll dice on. I see the reasons for it. I happen to have a computer while I play Traveller online with other players. So my program is right there on the screen if needed.

Now that I know how to program for the browser, I might one day try doing this for the web. We'll have to see.

-Shawn

### 1.2 Requirements

- **Microsoft Windows**

**PyTravCalc** is being tested on Windows 10. It has not been tested on MacOS or Linux.

- **Python 3.9**

**PyTravCalc** was written using the C implementation of Python version 3.9.4. Also known as CPython.

- **PyQt5 5.15.2**

PyQt5 is the framework used for displaying the Window GUI and buttons, etc.

- **numpy 1.20.2**

For building arrays.

- **matplotlib 3.4.1**

For graphics plotting.

<b>Warning:</b> PyTravCalc will not work with <b>Python 2.7-</b> .
--

## INSTALLING

### 2.1 Downloading PyTravCalc

Installing and using **PyTravCalc** seems simple enough. Just download the archive from [GitHub](#) and extract it to a folder you prefer.

### 2.2 About Fonts

TrueType fonts are included in the fonts folder. Add/install them to `C:\Windows\Fonts` if your system does not have them.

### 2.3 Running PyTravCalc

If you have Python 3.9.4 installed, you can start `pytravcalc310b.py` from a CMD prompt or double-click the Python script.

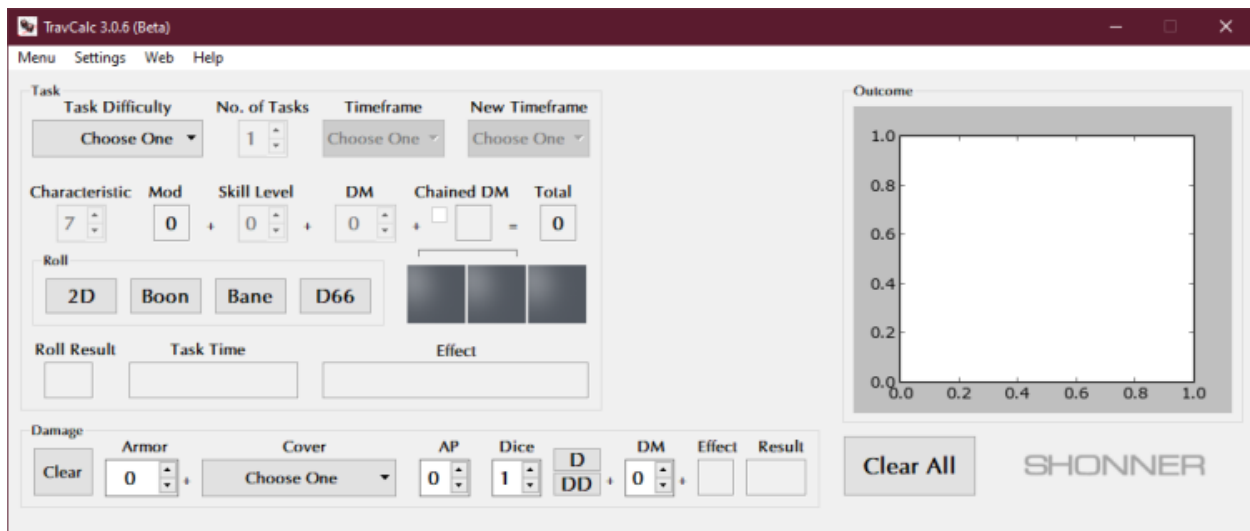

Alternatively, if you do not have Python 3.9.4, you can start `pytravcalc310b.exe` (located in the dist folder) from a CMD prompt or by double-clicking the executable program.

## PYTRAVCALC TUTORIAL

### 3.1 The GUI

After the program starts, there should be a screen that looks like:

The screen contains various outlined areas that are labeled as:

**Task:**

Choose the difficulty and die-modifiers for a task.

**Roll:**

Choose the roll type to perform.

**Damage:**

Calculate a damage roll.

**Outcome:**

Displays a plotted graph of the roll chances, and of the roll result if a difficulty is chosen.

---

**Note:** Plotted graphs are generated only when difficulties are selected. **D66** rolls will never generate graphs.

---

## 3.2 Making a Task Roll

Typically, task rolls will have a difficulty chosen by the game's referee. The player simply clicks the **Task Difficulty** button and clicks on the difficulty level. This will unlock the rest of the **Task** area that the player can fill in as well. It's pretty much self-explanatory how the rest is filled in. It is assumed that the player has a characteristic and a skill in mind when changing these values.

---

**Note:** The default **Characteristic** value is **7**. Be sure to input your character's own value in its place before rolling any dice. The same goes for the **Skill Level**, which has a default of **0**. Give it the value of your character's skill level for the task being done.

Don't worry about the characteristic **Mod** amount. Its value is calculated automatically, as well as the **DM Total**.

---

Once the DM is calculated, a roll is then made (determined by the referee). The dice will be shown. The roll **Result** and **Effect** will be calculated. And the **Task Time** will be calculated if a **Timeframe** was chosen.

A graph of the **Outcome** will then be displayed.

## 3.3 Making a Damage Roll

The **D** and **DD** rolls calculate the "soaking" of damage against armor. **Armor** amount is entered, along with hidden **Cover** amount and **AP** amount. The number of dice is selected. And a **DM** can be added before clicking either the **D** or **DD** roll buttons. The effect will be added to **D** rolls.

The **Clear** button will reset the damage area. The **Clear All** button will reset all the areas.

## 3.4 Settings Menu

Dice styles can be selected from the **Dice** menu. Voice styles (yes, voice styles) can be selected from the **Audio** menu.

---

**Note:** Only the **female voice** works with general die rolls (rolls made without a **Task Difficulty**).

---
